

A posteriori error estimates for linear and nonlinear evolution problems using space-time dual norms

Vít Dolejší, Alexandre Ern, and Martin Vohralík

Inria & ENPC, Paris

Oberwolfach, March 14, 2017

Outline

- 1 Introduction
- 2 How does it work: numerical experiments
- 3 Space-time mesh-dependent dual norm
- 4 Guaranteed estimate
- 5 Efficiency and robustness
- 6 Application: DG in space, CN in time
- 7 Conclusions and future work

Outline

- 1 Introduction
- 2 How does it work: numerical experiments
- 3 Space-time mesh-dependent dual norm
- 4 Guaranteed estimate
- 5 Efficiency and robustness
- 6 Application: DG in space, CN in time
- 7 Conclusions and future work

Literature: a posteriori estimates for the heat equation

- *Bieterman and Babuška (1982), Eriksson and Johnson (1991), Picasso (1998), Repin (2002), Makridakis and Nochetto (2003), Lakkis and Makridakis (2006), Demlow, Lakkis, and Makridakis (2009)*: upper bound for FEMs ($L^\infty(L^2)$, $L^\infty(L^\infty)$, or $L^2(H^1)$ (energy error)), possibly efficiency but under a restriction on the relative size of space and time steps or just order OK
- *Verfürth (2003), Bergam, Bernardi, and Mghazli (2004)*: local-in-time but global-in-space efficiency for FEM, robustness w.r.t. final time (energy error + $L^2(H^{-1})$ dual norm of the time derivative)
- *Ern and V. (2010)*: extension to a unified framework for spatial discretizations (DGs, NC FEMs, MFEMs, FVs)
- *Schötzau and Wihler (2010)*: energy error, higher-order time stepping, semi-discretizations in time
- *Georgoulis, Lakkis, and Virtanen (2011)*: DGs
- ...

Literature: advection and nonlinear problems

Linear advection-diffusion problems

- Verfürth (2005): efficiency and robustness w.r.t. advection dominance (energy error + $L^2(H^{-1})$ dual norm of the material derivative), reaction-diffusion solve on each time step

Nonlinear problems

- Verfürth (1998): efficiency under a restriction on the relative size of space and time steps
- Verfürth (2004): efficiency (no restriction) but need to solve a linear diffusion problem on each time step
- Makridakis and Nochetto (2006): higher-order time stepping, semi-discretizations in time
- Kreuzer (2013): efficiency using a dual quasi-norm (parabolic p -Laplacian)
- Bernardi, Dakroub, Mansour, and Sayah (2016), Amrein and Wihler (2016): adaptive linearization
- ...

Literature: advection and nonlinear problems

Linear advection-diffusion problems

- Verfürth (2005): efficiency and robustness w.r.t. advection dominance (energy error + $L^2(H^{-1})$ dual norm of the material derivative), reaction-diffusion solve on each time step

Nonlinear problems

- Verfürth (1998): efficiency under a restriction on the relative size of space and time steps
- Verfürth (2004): efficiency (no restriction) but need to solve a linear diffusion problem on each time step
- Makridakis and Nochetto (2006): higher-order time stepping, semi-discretizations in time
- Kreuzer (2013): efficiency using a dual quasi-norm (parabolic p -Laplacian)
- Bernardi, Dakroub, Mansour, and Sayah (2016), Amrein and Wihler (2016): adaptive linearization
- ...

Literature: degenerate problems

- Nocetto, Schmidt, and Verdi (2000), Ohlberger (2001): degenerate problems, **upper bound**
- Di Pietro, V., and Yousef (2015) – Stefan problem (degenerate diffusion), Cancès, Pop, and V. (2014) – two-phase porous media flow (coupled, advection, degenerate diffusion): adaptive regularization, linearization, discretization, and linear algebra; **upper bound** and **efficiency**

Problem

Problem

$$\begin{aligned} \partial_t u - \nabla \cdot \boldsymbol{\sigma}(u, \nabla u) &= f && \text{in } Q := \Omega \times (0, t_F), \\ u &= 0 && \text{on } \partial\Omega \times (0, t_F), \\ u(\cdot, 0) &= u_0 && \text{in } \Omega \end{aligned}$$

- $\Omega \subset \mathbb{R}^d$, $d \geq 2$: polytopal domain
- $t_F > 0$: final simulation time
- $f \in L^2(Q)$: source term
- $u_0 \in L^2(\Omega)$: initial datum
- $\boldsymbol{\sigma}(u, \nabla u) \in [L^2(Q)]^d$: nonlinear (diffusive-advection) flux function, $\boldsymbol{\sigma}(u, \nabla u) := \mathbf{K}(u)\nabla u - \boldsymbol{\phi}(u)$

Overview of main results

Main result

$$\mathcal{J}_u(u_{h\tau}) \leq \left\{ \sum_{n=1}^N \sum_{T \in \bar{\mathcal{T}}^{n-1,n}} (\eta_T^n)^2 \right\}^{\frac{1}{2}} =: \eta,$$

$$\eta_T^n \leq C \mathcal{J}_u(u_{h\tau})|_{\omega_T \times I_n} \quad (f \text{ pw pol., quadrature err. small}).$$

Comments

- $\mathcal{J}_u(u_{h\tau}) = \mathcal{J}_{u,\text{FR}}(u_{h\tau}) + \text{jump terms}$, $\mathcal{J}_{u,\text{FR}}(u_{h\tau})$: space-time mesh-dependent dual norm stemming from the problem and meshes at hand
- $u_{h\tau}$: piecewise space-time polynomial approximation (nonconforming, general framework: verify 2 assumptions)
- η_T^n are easily and locally computable from $u_{h\tau}$
- guaranteed upper bound (constant one)
- η_T^n can be decomposed into error components (spatial, temporal, regularization, linearization, algebraic)

Overview of main results

Main result

$$\mathcal{J}_u(u_{h\tau}) \leq \left\{ \sum_{n=1}^N \sum_{T \in \bar{\mathcal{T}}^{n-1,n}} (\eta_T^n)^2 \right\}^{\frac{1}{2}} =: \eta,$$

$$\eta_T^n \leq C \mathcal{J}_u(u_{h\tau})|_{\omega_T \times I_n} \quad (f \text{ pw pol., quadrature err. small}).$$

Comments

- $\mathcal{J}_u(u_{h\tau}) = \mathcal{J}_{u,\text{FR}}(u_{h\tau}) + \text{jump terms}$, $\mathcal{J}_{u,\text{FR}}(u_{h\tau})$: space-time mesh-dependent dual norm stemming from the problem and meshes at hand
- $u_{h\tau}$: piecewise space-time polynomial approximation (nonconforming, general framework: verify 2 assumptions)
- η_T^n are easily and locally computable from $u_{h\tau}$
- guaranteed upper bound (constant one)
- η_T^n can be decomposed into error components (spatial, temporal, regularization, linearization, algebraic)

Comments

- **local space-time efficiency** and **robustness**:
 - C is independent of the final time t_F , domain Ω , nonlinear function σ , diffusion jumps, degenerate diffusion, advection dominance, and absolute and relative sizes of the space and time steps
 - C only depends on the space dimension d , shape-regularity of the meshes, maximal polynomial degree of $u_{h\tau}$, and maximal coarsening/refinement ratio (the last two dependencies removed while proceeding as in the talk by I. Smears - ESV HAL Preprint 01377086 (2016))

- estimates directly for the dual norm of the residual
- equivalence error–residual for nonlinear problems: a priori bounds of the linearized differential operator needed, difficult to trace the influence of nonlinearities & advection
- heat equation, conf. approximations: dual norm of the residual in $L^2(H^1) \cap H^1(H^{-1}) = \text{error in } L^2(H^1)$... energy estimates, results so far only under restrictions

Comments

- **local space-time efficiency** and **robustness**:
 - C is independent of the final time t_F , domain Ω , nonlinear function σ , diffusion jumps, degenerate diffusion, advection dominance, and absolute and relative sizes of the space and time steps
 - C only depends on the space dimension d , shape-regularity of the meshes, maximal polynomial degree of $u_{h\tau}$, and maximal coarsening/refinement ratio (the last two dependencies removed while proceeding as in the talk by I. Smears - ESV HAL Preprint 01377086 (2016))
- estimates directly for the dual norm of the residual
- equivalence error–residual for nonlinear problems: a priori bounds of the linearized differential operator needed, difficult to trace the influence of nonlinearities & advection
- heat equation, conf. approximations: dual norm of the residual in $L^2(H^1) \cap H^1(H^{-1}) = \text{error in } L^2(H^1)$... energy estimates, results so far only under restrictions

Comments

- **local space-time efficiency** and **robustness**:
 - C is independent of the final time t_F , domain Ω , nonlinear function σ , diffusion jumps, degenerate diffusion, advection dominance, and absolute and relative sizes of the space and time steps
 - C only depends on the space dimension d , shape-regularity of the meshes, maximal polynomial degree of $u_{h\tau}$, and maximal coarsening/refinement ratio (the last two dependencies removed while proceeding as in the talk by I. Smears - ESV HAL Preprint 01377086 (2016))

- heat equation, conf. approximations: dual norm of the residual in $L^2(H^1) \cap H^1(H^{-1}) =$ error in $L^2(H^1)$... energy estimates, results so far only under restrictions on h and τ

Easily computable upper bound on $\mathcal{J}_u(u_{h\tau})$

Weighted $L^2(Q)$ norm + jump terms

$$\mathcal{J}_{u,\text{FR}}(u_{h\tau}) \leq e_{\text{FR}} := \left\{ \sum_{n=1}^N \sum_{T \in \mathcal{T}^{n-1,n}} (e_{\text{FR},T}^n)^2 \right\}^{\frac{1}{2}}$$

$$e_{\text{FR},T}^n := C_{T,n}^{-\frac{1}{2}} \left\{ (\tau^n)^{-2} \|u_{h\tau} - u\|_{T \times I_n}^2 + h_T^{-2} \|\sigma(u, \nabla u) - \sigma(u_{h\tau}, \nabla u_{h\tau})\|_{T \times I_n}^2 \right\}^{\frac{1}{2}}$$

- typically $C_{T,n} := ((\tau^n)^{-2} t_F + h_T^{-2} C_{\phi,T,n} + h_T^{-2} C_{\underline{\mathbf{K}},T,n})$
- $C_{\phi,T,n} := h_\Omega \|\phi'(u_{h\tau})\|_{\infty,Q}$, h_Ω is the diameter of Ω
- $C_{\underline{\mathbf{K}},T,n} := (h_\Omega/h_T) \|\underline{\mathbf{K}}(u_{h\tau})\|_{\infty,Q}$
- the first two addends in $C_{T,n}$ are of similar size if the Courant numbers $\tau^n \|\phi'(u_{h\tau})\|_{\infty,Q}/h_T$ are of order unity, as well as the ratios $t_F \|\phi'(u_{h\tau})\|_{\infty,Q}/h_\Omega$ (the final time allows particles to be advected across a relevant part of Ω)
- the ratio of the second to the third addend is of the order of the Péclet numbers $h_T \|\phi'(u_{h\tau})\|_{\infty,Q} / \|\underline{\mathbf{K}}(u_{h\tau})\|_{\infty,Q}$

Outline

- 1 Introduction
- 2 How does it work: numerical experiments
- 3 Space-time mesh-dependent dual norm
- 4 Guaranteed estimate
- 5 Efficiency and robustness
- 6 Application: DG in space, CN in time
- 7 Conclusions and future work

Setting

Setting

- incomplete interior penalty discontinuous Galerkin space discretization with polynomial degrees $p = 1, 2, 3$
- Crank–Nicolson in time
- space and time meshes both uniformly refined: $m = 1, 2, 3$

Effectivity indices

- dual norm

$$i_e := \frac{\eta}{\mathcal{J}_u(u_{h\tau})} = \frac{\eta}{\mathcal{J}_{u,\text{FR}}(u_{h\tau}) + \text{jumps}} \geq 1$$

- weighted L^2 norm:

$$i_{e,\text{FR}} := \frac{\eta}{e_{\text{FR}} + \text{jumps}} (< 1 \text{ possible})$$

Setting

Setting

- incomplete interior penalty discontinuous Galerkin space discretization with polynomial degrees $p = 1, 2, 3$
- Crank–Nicolson in time
- space and time meshes both uniformly refined: $m = 1, 2, 3$

Effectivity indices

- dual norm

$$i_e := \frac{\eta}{\mathcal{J}_u(u_{h\tau})} = \frac{\eta}{\mathcal{J}_{u,\text{FR}}(u_{h\tau}) + \text{jumps}} \geq 1$$

- weighted L^2 norm:

$$i_{e,\text{FR}} := \frac{\eta}{e_{\text{FR}} + \text{jumps}} (< 1 \text{ possible})$$

Viscous Burgers equation

Viscous Burgers equation

$$\partial_t u - \nabla \cdot (\varepsilon \nabla u - \phi(u)) = 0 \quad \text{in } Q$$

- $\varepsilon = 10^{-2}$ or $\varepsilon = 10^{-4}$
- $\phi(u) = (u^2/2, u^2/2)^T$
- $\Omega = (-1, 1) \times (-1, 1)$
- $t_F = 1$

Exact solution

$$u(x, y, t) = \left(1 + \exp \left(\frac{x + y + 1 - t}{2\varepsilon} \right) \right)^{-1}$$

Viscous Burgers equation

Viscous Burgers equation

$$\partial_t u - \nabla \cdot (\varepsilon \nabla u - \phi(u)) = 0 \quad \text{in } Q$$

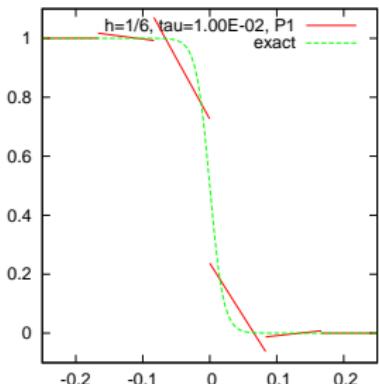

- $\varepsilon = 10^{-2}$ or $\varepsilon = 10^{-4}$
- $\phi(u) = (u^2/2, u^2/2)^T$
- $\Omega = (-1, 1) \times (-1, 1)$
- $t_F = 1$

Exact solution

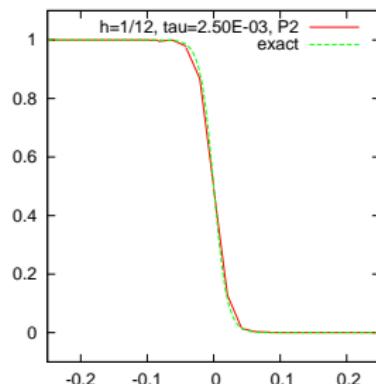

$$u(x, y, t) = \left(1 + \exp \left(\frac{x + y + 1 - t}{2\varepsilon} \right) \right)^{-1}$$

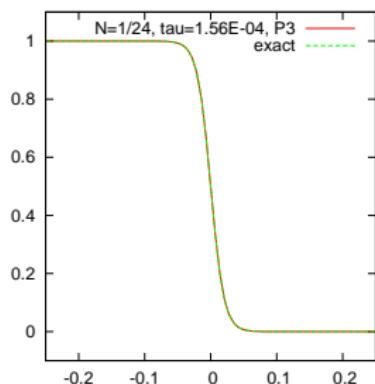

Exact and approximate solutions, $\varepsilon = 10^{-2}$

Degenerate advection-diffusion equation

Degenerate advection-diffusion problem (Kačur 2001)

$$\partial_t u - \nabla \cdot (2\varepsilon u \nabla u - \phi(u)) = 0 \quad \text{in } Q$$

- $\varepsilon = 10^{-2}$
- $\phi(u) = 0.5(u^2, 0)^T$
- $\Omega = (0, 1) \times (0, 1)$
- $t_F = 1$

Exact solution

$$u(x, y, t) = \begin{cases} 1 - \exp\left(\frac{v(x-vt-x_0)}{2\varepsilon}\right) & \text{for } x \leq vt + x_0, \\ 0 & \text{for } x > vt + x_0 \end{cases}$$

- $x_0 = 1/4$ is the initial position of the front

Degenerate advection-diffusion equation

Degenerate advection-diffusion problem (Kačur 2001)

$$\partial_t u - \nabla \cdot (2\varepsilon u \nabla u - \phi(u)) = 0 \quad \text{in } Q$$

- $\varepsilon = 10^{-2}$
- $\phi(u) = 0.5(u^2, 0)^T$
- $\Omega = (0, 1) \times (0, 1)$
- $t_F = 1$

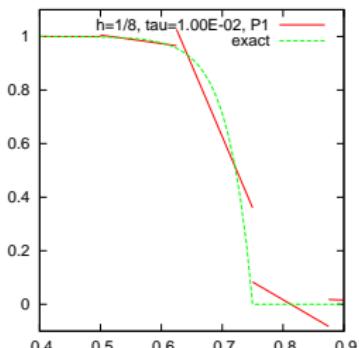

Exact solution

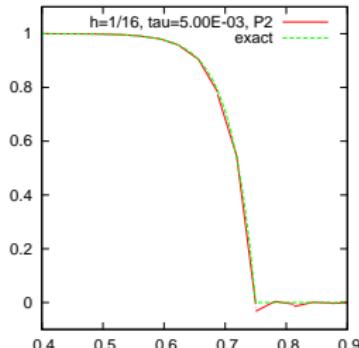

$$u(x, y, t) = \begin{cases} 1 - \exp\left(\frac{v(x-vt-x_0)}{2\varepsilon}\right) & \text{for } x \leq vt + x_0, \\ 0 & \text{for } x > vt + x_0 \end{cases}$$

- $x_0 = 1/4$ is the initial position of the front

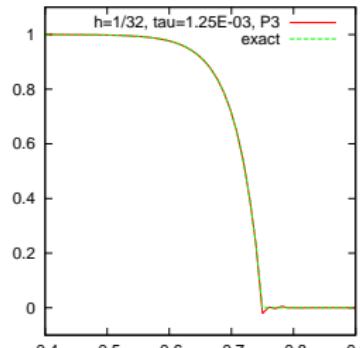

Exact and approximate solutions

P_1 approximation on
 $\{h_1, \tau_1\}$

P_2 approximation on
 $\{h_2, \tau_2\}$

P_3 approximation on
 $\{h_3, \tau_3\}$

- 3 Space-time mesh-dependent dual norm
- 4 Guaranteed estimate
- 5 Efficiency and robustness
- 6 Application: DG in space, CN in time
- 7 Conclusions and future work

Weak solution

Weak solution

Find $\textcolor{red}{u} \in X$ such that, for all $\varphi \in Y$,

$$\int_0^{t_F} \{(f, \varphi) + (u, \partial_t \varphi) - (\sigma(u, \nabla u), \nabla \varphi)\}(t) dt + (u_0, \varphi(\cdot, 0)) = 0$$

- $\textcolor{red}{X} := L^2(0, t_F; H_0^1(\Omega))$
- $\textcolor{red}{Y} := \{\varphi \in X; \partial_t \varphi \in L^2(Q); \varphi(\cdot, t_F) = 0\}$

Comments

- ultra-weak spirit (time derivatives on the test functions)
- $\partial_t \varphi \in L^2(Q)$ on purpose: we can easily evaluate the norm on the test space in contrast to $\partial_t \varphi \in L^2(0, t_F; H^{-1}(\Omega))$

Weak solution

Weak solution

Find $\textcolor{red}{u} \in X$ such that, for all $\varphi \in Y$,

$$\int_0^{t_F} \{(f, \varphi) + (u, \partial_t \varphi) - (\sigma(u, \nabla u), \nabla \varphi)\}(t) dt + (u_0, \varphi(\cdot, 0)) = 0$$

- $\textcolor{red}{X} := L^2(0, t_F; H_0^1(\Omega))$
- $\textcolor{red}{Y} := \{\varphi \in X; \partial_t \varphi \in L^2(Q); \varphi(\cdot, t_F) = 0\}$

Comments

- ultra-weak spirit (time derivatives on the test functions)
- $\partial_t \varphi \in L^2(Q)$ on purpose: we can easily evaluate the norm on the test space in contrast to $\partial_t \varphi \in L^2(0, t_F; H^{-1}(\Omega))$

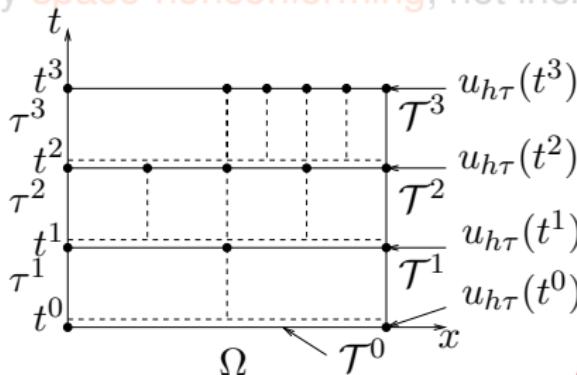

Discrete setting

Discrete setting

- discrete times $\{t^n\}_{0 \leq n \leq N}$, $t^0 = 0$ and $t^N = t_F$
- time intervals $I_n := (t^{n-1}, t^n]$ and time steps $\tau^n := t^n - t^{n-1}$
- a different simplicial mesh \mathcal{T}^n on all $0 \leq n \leq N$
 - $\bar{\mathcal{T}}^{n-1,n}$: the coarsest common refinement of \mathcal{T}^{n-1} and \mathcal{T}^n
 - $\underline{\mathcal{T}}^{n-1,n}$: the finest common coarsening of \mathcal{T}^{n-1} and \mathcal{T}^n

Approximate solution

- $u_{h\tau} \in X_h := \{\varphi \in L^2(0, t_F; H^1(\mathcal{T})) ; \partial_t \varphi \in L^2(Q)\}$ (time-conf.)
- $u_{h\tau}$ possibly space-nonconforming, not included in X

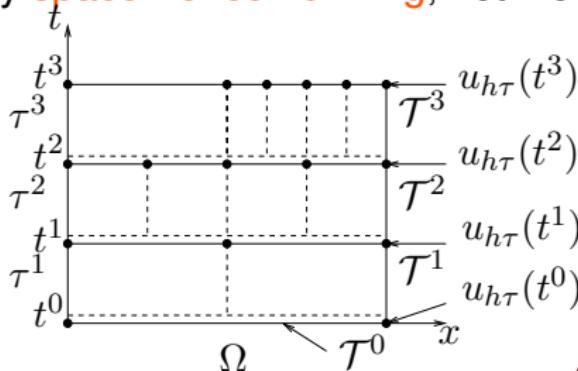

Discrete setting

Discrete setting

- discrete times $\{t^n\}_{0 \leq n \leq N}$, $t^0 = 0$ and $t^N = t_F$
- time intervals $I_n := (t^{n-1}, t^n]$ and time steps $\tau^n := t^n - t^{n-1}$
- a different simplicial mesh \mathcal{T}^n on all $0 \leq n \leq N$
 - $\bar{\mathcal{T}}^{n-1,n}$: the coarsest common refinement of \mathcal{T}^{n-1} and \mathcal{T}^n
 - $\underline{\mathcal{T}}^{n-1,n}$: the finest common coarsening of \mathcal{T}^{n-1} and \mathcal{T}^n

Approximate solution

- $u_{h\tau} \in X_h := \{\varphi \in L^2(0, t_F; H^1(\mathcal{T})) ; \partial_t \varphi \in L^2(Q)\}$ (time-conf.)
- $u_{h\tau}$ possibly space-nonconforming, not included in X

Space-time mesh-dependent dual norm

Residual

For $v \in L^2(0, t_F; H^1(\mathcal{T}))$, $R(v) \in Y'$: for all $\varphi \in Y$,

$$\langle R(v), \varphi \rangle_{Y', Y} := \int_0^{t_F} \{(f, \varphi) + (v, \partial_t \varphi) - (\sigma(v, \nabla v), \nabla \varphi)\}(t) dt + (u_0, \varphi(\cdot, 0))$$

Dual norm of the residual

$$\mathcal{J}_{u, \text{FR}}(u_{h\tau}) := \sup_{\varphi \in Y, \|\varphi\|_Y=1} \langle R(u_{h\tau}), \varphi \rangle_{Y', Y}$$

$$\mathcal{J}_{u, \text{FR}}(u_{h\tau}) = \sup_{\varphi \in Y, \|\varphi\|_Y=1} \int_0^{t_F} \{(u_{h\tau} - u, \partial_t \varphi) + (\sigma(u, \nabla u) - \sigma(u_{h\tau}, \nabla u_{h\tau}), \nabla \varphi)\}(t) dt$$

Space-time mesh-dependent norm on Y

$$\|\varphi\|_{Y, T \times I_n}^2 := C_{T,n} (\mathbf{h}_T^{-2} \|\nabla \varphi\|_{T \times I_n}^2 + (\tau^n)^2 \|\partial_t \varphi\|_{T \times I_n}^2),$$

$$\|\varphi\|_Y^2 := \sum_{n=1}^N \sum_{T \in \mathcal{T}^{n-1, n}} \|\varphi\|_{Y, T \times I_n}^2$$

- $C_{T,n}$: user-given weights (no impact on a posteriori results)

Space-time mesh-dependent dual norm

Residual

For $v \in L^2(0, t_F; H^1(\mathcal{T}))$, $R(v) \in Y'$: for all $\varphi \in Y$,

$$\langle R(v), \varphi \rangle_{Y', Y} := \int_0^{t_F} \{(f, \varphi) + (v, \partial_t \varphi) - (\sigma(v, \nabla v), \nabla \varphi)\}(t) dt + (u_0, \varphi(\cdot, 0))$$

Dual norm of the residual

$$\mathcal{J}_{u, \text{FR}}(u_{h\tau}) := \sup_{\varphi \in Y, \|\varphi\|_Y=1} \langle R(u_{h\tau}), \varphi \rangle_{Y', Y}$$

$$\mathcal{J}_{u, \text{FR}}(u_{h\tau}) = \sup_{\varphi \in Y, \|\varphi\|_Y=1} \int_0^{t_F} \{(u_{h\tau} - u, \partial_t \varphi) + (\sigma(u, \nabla u) - \sigma(u_{h\tau}, \nabla u_{h\tau}), \nabla \varphi)\}(t) dt$$

Space-time mesh-dependent norm on Y

$$\|\varphi\|_{Y, T \times I_n}^2 := C_{T,n} (\mathbf{h}_T^{-2} \|\nabla \varphi\|_{T \times I_n}^2 + (\tau^n)^2 \|\partial_t \varphi\|_{T \times I_n}^2),$$

$$\|\varphi\|_Y^2 := \sum_{n=1}^N \sum_{T \in \mathcal{T}^{n-1, n}} \|\varphi\|_{Y, T \times I_n}^2$$

- $C_{T,n}$: user-given weights (no impact on a posteriori results)

Space-time mesh-dependent dual norm

Residual

For $v \in L^2(0, t_F; H^1(\mathcal{T}))$, $R(v) \in Y'$: for all $\varphi \in Y$,

$$\langle R(v), \varphi \rangle_{Y', Y} := \int_0^{t_F} \{(f, \varphi) + (v, \partial_t \varphi) - (\sigma(v, \nabla v), \nabla \varphi)\}(t) dt + (u_0, \varphi(\cdot, 0))$$

Dual norm of the residual

$$\mathcal{J}_{u, \text{FR}}(u_{h\tau}) := \sup_{\varphi \in Y, \|\varphi\|_Y=1} \langle R(u_{h\tau}), \varphi \rangle_{Y', Y}$$

$$\mathcal{J}_{u, \text{FR}}(u_{h\tau}) = \sup_{\varphi \in Y, \|\varphi\|_Y=1} \int_0^{t_F} \{(u_{h\tau} - u, \partial_t \varphi) + (\sigma(u, \nabla u) - \sigma(u_{h\tau}, \nabla u_{h\tau}), \nabla \varphi)\}(t) dt$$

Space-time mesh-dependent norm on Y

$$\|\varphi\|_{Y, T \times I_n}^2 := C_{T,n} (\textcolor{brown}{h\tau}^2 \|\nabla \varphi\|_{T \times I_n}^2 + (\textcolor{brown}{\tau^n})^2 \|\partial_t \varphi\|_{T \times I_n}^2),$$

$$\|\varphi\|_Y^2 := \sum_{n=1}^N \sum_{T \in \mathcal{T}^{n-1, n}} \|\varphi\|_{Y, T \times I_n}^2$$

- $C_{T,n}$: user-given weights (no impact on a posteriori results)

Space-time mesh-dependent dual norm

Residual

For $v \in L^2(0, t_F; H^1(\mathcal{T}))$, $R(v) \in Y'$: for all $\varphi \in Y$,

$$\langle R(v), \varphi \rangle_{Y', Y} := \int_0^{t_F} \{(f, \varphi) + (v, \partial_t \varphi) - (\sigma(v, \nabla v), \nabla \varphi)\}(t) dt + (u_0, \varphi(\cdot, 0))$$

Dual norm of the residual

$$\mathcal{J}_{u, \text{FR}}(u_{h\tau}) := \sup_{\varphi \in Y, \|\varphi\|_Y=1} \langle R(u_{h\tau}), \varphi \rangle_{Y', Y}$$

$$\mathcal{J}_{u, \text{FR}}(u_{h\tau}) = \sup_{\varphi \in Y, \|\varphi\|_Y=1} \int_0^{t_F} \{(u_{h\tau} - u, \partial_t \varphi) + (\sigma(u, \nabla u) - \sigma(u_{h\tau}, \nabla u_{h\tau}), \nabla \varphi)\}(t) dt$$

Space-time mesh-dependent norm on Y

$$\|\varphi\|_{Y, T \times I_n}^2 := C_{T, n} (\textcolor{red}{h_T}^2 \|\nabla \varphi\|_{T \times I_n}^2 + (\textcolor{red}{\tau^n})^2 \|\partial_t \varphi\|_{T \times I_n}^2),$$

$$\|\varphi\|_Y^2 := \sum_{n=1}^N \sum_{T \in \mathcal{T}^{n-1, n}} \|\varphi\|_{Y, T \times I_n}^2$$

- $C_{T, n}$: user-given weights (no impact on a posteriori results)

Evaluating $\mathcal{J}_{u,\text{FR}}(u_{h\tau})$

- $\mathcal{J}_{u,\text{FR}}(u_{h\tau})$ cannot be computed easily in practice (in the test cases where the exact solution u is available)
- solve the infinite-dimensional space-time dual problem:
find $\psi \in Y$ such that

$$(\psi, \varphi)_Y = \langle R(u_{h\tau}), \varphi \rangle_{Y', Y} \quad \forall \varphi \in Y,$$

where $(\cdot, \cdot)_Y$ denotes the inner product corresponding to the $\|\cdot\|_Y$ -norm

- then

$$\mathcal{J}_{u,\text{FR}}(u_{h\tau}) = \|\psi\|_Y$$

- evaluate $\mathcal{J}_{u,\text{FR}}(u_{h\tau})$ = solve a space-time problem in $H^1(Q)$
(0 at the final time)
- for numerical experiments, approximated on a finer mesh

Total error measure

Properties of the dual norm of the residual $\mathcal{J}_{u,\text{FR}}(u_{h\tau})$

- for $u_{h\tau} \in X$, $\mathcal{J}_{u,\text{FR}}(u_{h\tau}) = 0$ if and only if $u_{h\tau} = u$

Nonconformity evaluation

$$\mathcal{J}_{u,\text{NC}}(u_{h\tau}) := \left\{ \sum_{n=1}^N \sum_{T \in \bar{\mathcal{T}}^{n-1,n}} \sum_{F \in \mathcal{F}_T} C_{T,n}^{-1} h_T^{-2} C_{\underline{K},\phi,T,F,n} \| [u - u_{h\tau}] \|_{F \times I_n}^2 \right\}^{\frac{1}{2}}$$

- $\mathcal{J}_{u,\text{NC}}(u_{h\tau}) = 0$ if and only if $u_{h\tau} \in X$
- easily computable
- $C_{\underline{K},\phi,T,F,n}$: weights (problem- and scheme-given)

Total error measure

$$\mathcal{J}_u(u_{h\tau}) := \mathcal{J}_{u,\text{FR}}(u_{h\tau}) + \mathcal{J}_{u,\text{NC}}(u_{h\tau})$$

- $\mathcal{J}_u(u_{h\tau}) = 0$ if and only if $u_{h\tau} = u$

Total error measure

Properties of the dual norm of the residual $\mathcal{J}_{u,\text{FR}}(u_{h\tau})$

Outline

- 1 Introduction
- 2 How does it work: numerical experiments
- 3 Space-time mesh-dependent dual norm
- 4 Guaranteed estimate
- 5 Efficiency and robustness
- 6 Application: DG in space, CN in time
- 7 Conclusions and future work

Equilibrated flux reconstruction

Assumption (Space-time equilibrated flux reconstruction)

*There exists a **flux reconstruction** $\mathbf{t}_{h\tau}$ such that*

$$\mathbf{t}_{h\tau} \in \mathbf{L}^2(0, t_F; \mathbf{H}(\text{div}, \Omega))$$

and

$$(f - \partial_t u_{h\tau} - \nabla \cdot \mathbf{t}_{h\tau}, 1)_{T \times I_n} = 0 \quad \forall 1 \leq n \leq N, \forall T \in \mathcal{T}^{n-1,n}.$$

Comments

- the equilibration assumption expresses **local mass conservation** over the **space-time element** $T \times I_n$
- equilibrium not requested everywhere in time as in the talk by I Smears - ESV HAL Preprint 01377086 (2016)
- seems suitable for space-time methods
- both $u_{h\tau}$ and $\mathbf{t}_{h\tau}$ of same polynomial degree in time
- practical construction of $\mathbf{t}_{h\tau}$: spatial discretization at hand
 - implicit constructions by patchwise MFE problems (sharper, p -robust) (talk by I. Smears)
 - explicit constructions (cheaper) (shown here later)

Guaranteed upper bound

Theorem (Guaranteed a posteriori error estimate)

Let $\textcolor{orange}{u}$ be the weak solution. Let $u_{h\tau} \in X_h$ be arbitrary. Let the equilibration assumption hold true. Then

$$\mathcal{J}_u(u_{h\tau}) \leq \eta_{\text{FR}} + \eta_{\text{NC}} + \eta_{\text{IC}}.$$

Comments

- no definition of any numerical scheme needed
- hinges only on the equilibration assumption

Guaranteed upper bound

Proof idea

Bounding the element residual

- Verfürth's bubble function technique
- $v_{T,n} := (f - \partial_t u_{h\tau} + \nabla \cdot \sigma(u_{h\tau}, \nabla u_{h\tau}))|_{T \times I_n}$
- space-time bubble $\psi_{T,n}$, product of the barycentric coordinates on T and of the barycentric coordinates on I_n
- norm equivalence in finite-dimensional spaces:

$$(v_{T,n}, v_{T,n})_{T \times I_n} \lesssim (\psi_{T,n} v_{T,n}, \psi_{T,n} v_{T,n})_{T \times I_n}$$

- inverse inequality separately in space and in time:

$$\begin{aligned} h_T \|\nabla(\psi_{T,n} v_{T,n})\|_{T \times I_n} &\lesssim \|\psi_{T,n} v_{T,n}\|_{T \times I_n}, \\ \tau^n \|\partial_t(\psi_{T,n} v_{T,n})\|_{T \times I_n} &\lesssim \|\psi_{T,n} v_{T,n}\|_{T \times I_n} \end{aligned}$$

Proof idea

- definition of $v_{T,n}$, bubble inequality, weak solution definition, and the Green theorem ($\sigma_d := \sigma(u, \nabla u) - \bar{\sigma}(u_{h\tau}, \nabla u_{h\tau})$),

$$\begin{aligned} C_{T,n}^{-1} \|v_{T,n}\|_{T \times I_n}^2 &\lesssim C_{T,n}^{-1} (f - \partial_t u_{h\tau} + \nabla \cdot \bar{\sigma}(u_{h\tau}, \nabla u_{h\tau}), \psi_{T,n} v_{T,n})_{T \times I_n} \\ &= C_{T,n}^{-1} (u_{h\tau} - u, \partial_t(\psi_{T,n} v_{T,n}))_{T \times I_n} + (\sigma_d, \nabla(\psi_{T,n} v_{T,n}))_{T \times I_n} \end{aligned}$$

- thus $C_{T,n}^{-\frac{1}{2}} \|v_{T,n}\|_{T \times I_n} \lesssim$

$$\frac{(u_{h\tau} - u, \partial_t(\psi_{T,n} v_{T,n}))_{T \times I_n} + (\sigma_d, \nabla(\psi_{T,n} v_{T,n}))_{T \times I_n}}{\|\psi_{T,n} v_{T,n}\|_{Y,T \times I_n}} \frac{C_{T,n}^{-\frac{1}{2}} \|\psi_{T,n} v_{T,n}\|_{Y,T \times I_n}}{\|v_{T,n}\|_{T \times I_n}}$$

- definition of the $\|\cdot\|_{Y,T \times I_n}$ norm, inverse ineq., $\|\psi_{T,n} v_{T,n}\|_{\infty, T \times I_n} \leq 1$

$$\begin{aligned} C_{T,n}^{-1} \|\psi_{T,n} v_{T,n}\|_{Y,T \times I_n}^2 &= (h_T^2 \|\nabla(\psi_{T,n} v_{T,n})\|_{T \times I_n}^2 + (\tau^n)^2 \|\partial_t(\psi_{T,n} v_{T,n})\|_{T \times I_n}^2) \\ &\lesssim \|\psi_{T,n} v_{T,n}\|_{T \times I_n}^2 \leq \|v_{T,n}\|_{T \times I_n}^2 \end{aligned}$$

- thus:

$$C_{T,n}^{-\frac{1}{2}} \|v_{T,n}\|_{T \times I_n} \lesssim \frac{(u_{h\tau} - u, \partial_t(\psi_{T,n} v_{T,n}))_{T \times I_n} + (\sigma_d, \nabla(\psi_{T,n} v_{T,n}))_{T \times I_n}}{\|\psi_{T,n} v_{T,n}\|_{Y,T \times I_n}},$$

Conclusions and future work

Conclusions

- space-time mesh-dependent dual norm stemming from the problem and meshes at hand
- guaranteed estimates
- **robustness** w.r.t. nonlinearity, final time, advection dominance, degenerate diffusion, discretization parameters
- **unified framework** (two conditions to verify for application)

Future work

- robustness in other norms
- extension to more complex problems

Thank you for your attention!

- space-time mesh-dependent dual norm stemming from the problem and meshes at hand
- guaranteed estimates
- **robustness** w.r.t. nonlinearity, final time, advection dominance, degenerate diffusion, discretization parameters
- **unified framework** (two conditions to verify for application)

Future work

- robustness in other norms
- extension to more complex problems

Thank you for your attention!

DOLEJŠÍ V., ERN A., VOHRALÍK M., A framework for robust a posteriori error control in unsteady nonlinear advection-diffusion problems, *SIAM J. Numer. Anal.* 51(2013), 773–793

Conclusions and future work

Conclusions

- space-time mesh-dependent dual norm stemming from the problem and meshes at hand
- guaranteed estimates
- **robustness** w.r.t. nonlinearity, final time, advection dominance, degenerate diffusion, discretization parameters
- **unified framework** (two conditions to verify for application)

A Posteriori Error Estimates Adaptivity and Advanced Applications

Thursday 4th and Friday 5th May 2017

Speakers

- Sören Bartels
- Roland Becker
- Claudio Canuto
- Carsten Carstensen
- Emmanuel Creusé
- Lars Diening
- Christian Kreuzer
- Charalambos Makridakis
- Markus Melenk
- Pedro Morin
- Dirk Praetorius
- Iain Smears
- Rob Stevenson
- Andreas Veeser
- Thomas Wihler

Venue

Inria Paris,
2 Rue Simone Iff,
12th Arrondissement,
Paris 75012

*Jacques-Louis Lions room,
ground floor, building C*

Organisers Alexandre Ern, Iain Smears & Martin Vohralík
