my position, my body
what I see, hear, smell, feel, think,...

Full imbrication of
the virtual world and
the real world

Transformation
physical to digital
digital to physical (3d printers)

The intuition of a virtual world

...In that Empire, the Art of Cartography attained such Perfection that the map of a single Province occupied the entirety of a City, and the map of the Empire, the entirety of a Province. In time, those Unconscionable Maps no longer satisfied, and the Cartographers Guilds struck a **Map of the Empire whose size was that of the Empire**, and which coincided point for point with it. . .

On Exactitude in Science
Jorge Luis Borges, 1946

Data: building blocks of the information society

Data deluge in all sectors

U.S. Library of Congress:

235 Terabytes of data

Walmart: 2.5 petabytes of data,

1 million customer transactions / hour

Facebook: 30 Petabytes of user data

Google: processing 20 petabytes a day (2008)

World: 5 billion people calling,

tweeting, browsing on mobile phones

kilo 10^3

mega 10^6

giga 10^9

tera 10^{12}

peta 10^{15}

exa 10^{18}

The digital universe

2.7 zettabytes in 2012

Exponential increase

doubles every other year

with the capacity to store,
compute, and communicate

35 zettabytes in 2020

kilo	10^3
mega	10^6
giga	10^9
tera	10^{12}
peta	10^{15}
exa	10^{18}
<u>zetta</u>	10^{21}
yotta	10^{24}

The physical infrastructure

Data centers

The physical infrastructure

Data centers

Energy consumption: 250 TWh in 2010

about half of electricity consumption in France
about 30 nuclear plants

http://www.nytimes.com/2012/09/23/technology/data-centers-waste-vast-amounts-of-energy-belying-industry-image.html?_r=1&pagewanted=all

Today's rapidly growing flood of big data represents immense opportunity for forward-thinking marketers. But to fully leverage the potential that exists within these massive streams of structured and unstructured data, organizations must quickly optimize ad delivery, evaluate campaign results, improve site selection and retarget ads. This is where the IBM Netezza® Factor comes into play, enabling a fluid analysis of complex data capable of unleashing a torrent of innovative, next-level ideas and results.

DRIVING MARKETING EFFECTIVENESS BY MANAGING THE FLOOD OF BIG DATA

BIG DATA = BIG OPPORTUNITY

35 ZETTABYTES OF DATA GENERATED ANNUALLY BY 2020

60% GROWTH IN STRUCTURED AND UNSTRUCTURED DATA ANNUALLY

2.7 ZETTABYTES OF DATA EXIST

GROWTH
IN UNSTRUCTURED DATA*

5
EXABYTES
OF DATA GENERATED
EVERY TWO DAYS*

CAPITALIZING ON THIS OPPORTUNITY WILL REQUIRE:

- BUSINESS-DRIVEN INTEGRATION OF DISPARATE DATA
- IMPROVED OPERATING INFRASTRUCTURES
- NETWORK OF DATA-CENTRIC TECHNOLOGY AND PARTNERS
- MARKETING DATA GOVERNANCE

MARKETERS CAN THEN OPTIMIZE IN FOUR PRIMARY WAYS:

AUDIENCE OPTIMIZATION
Identify high-potential audiences and accurately target them

CONTENT OPTIMIZATION
Enable the right message at the right time via the right content targeting

YIELD OPTIMIZATION
Maximize ad inventory by identifying high-value audiences across publisher properties

CHANNEL OPTIMIZATION
Optimize ad media purchase, understanding value of channels higher up in the funnel

Epsilon
Epsilon leveraged the IBM Netezza data warehouse appliance to simplify advanced analytics on massive data volumes, increasing retention and revenues by 20 percent

Kelley Blue Book
KBB used the IBM Netezza data warehouse appliance to personalize content, improving conversion rates and reducing model processing time from 3 days to 1

MediaMath
MediaMath used the IBM Netezza data warehouse appliance to measure 13 billion ad impressions a day, requiring half the manpower to deliver 10x the output.

Merkle
Merkle used IBM Netezza advanced analytics software to achieve a 50 percent decrease in end-to-end run time for marketing campaign execution.

“Google is a Vacuum cleaner for revenue”

Barry Diller

Quarterly Revenues

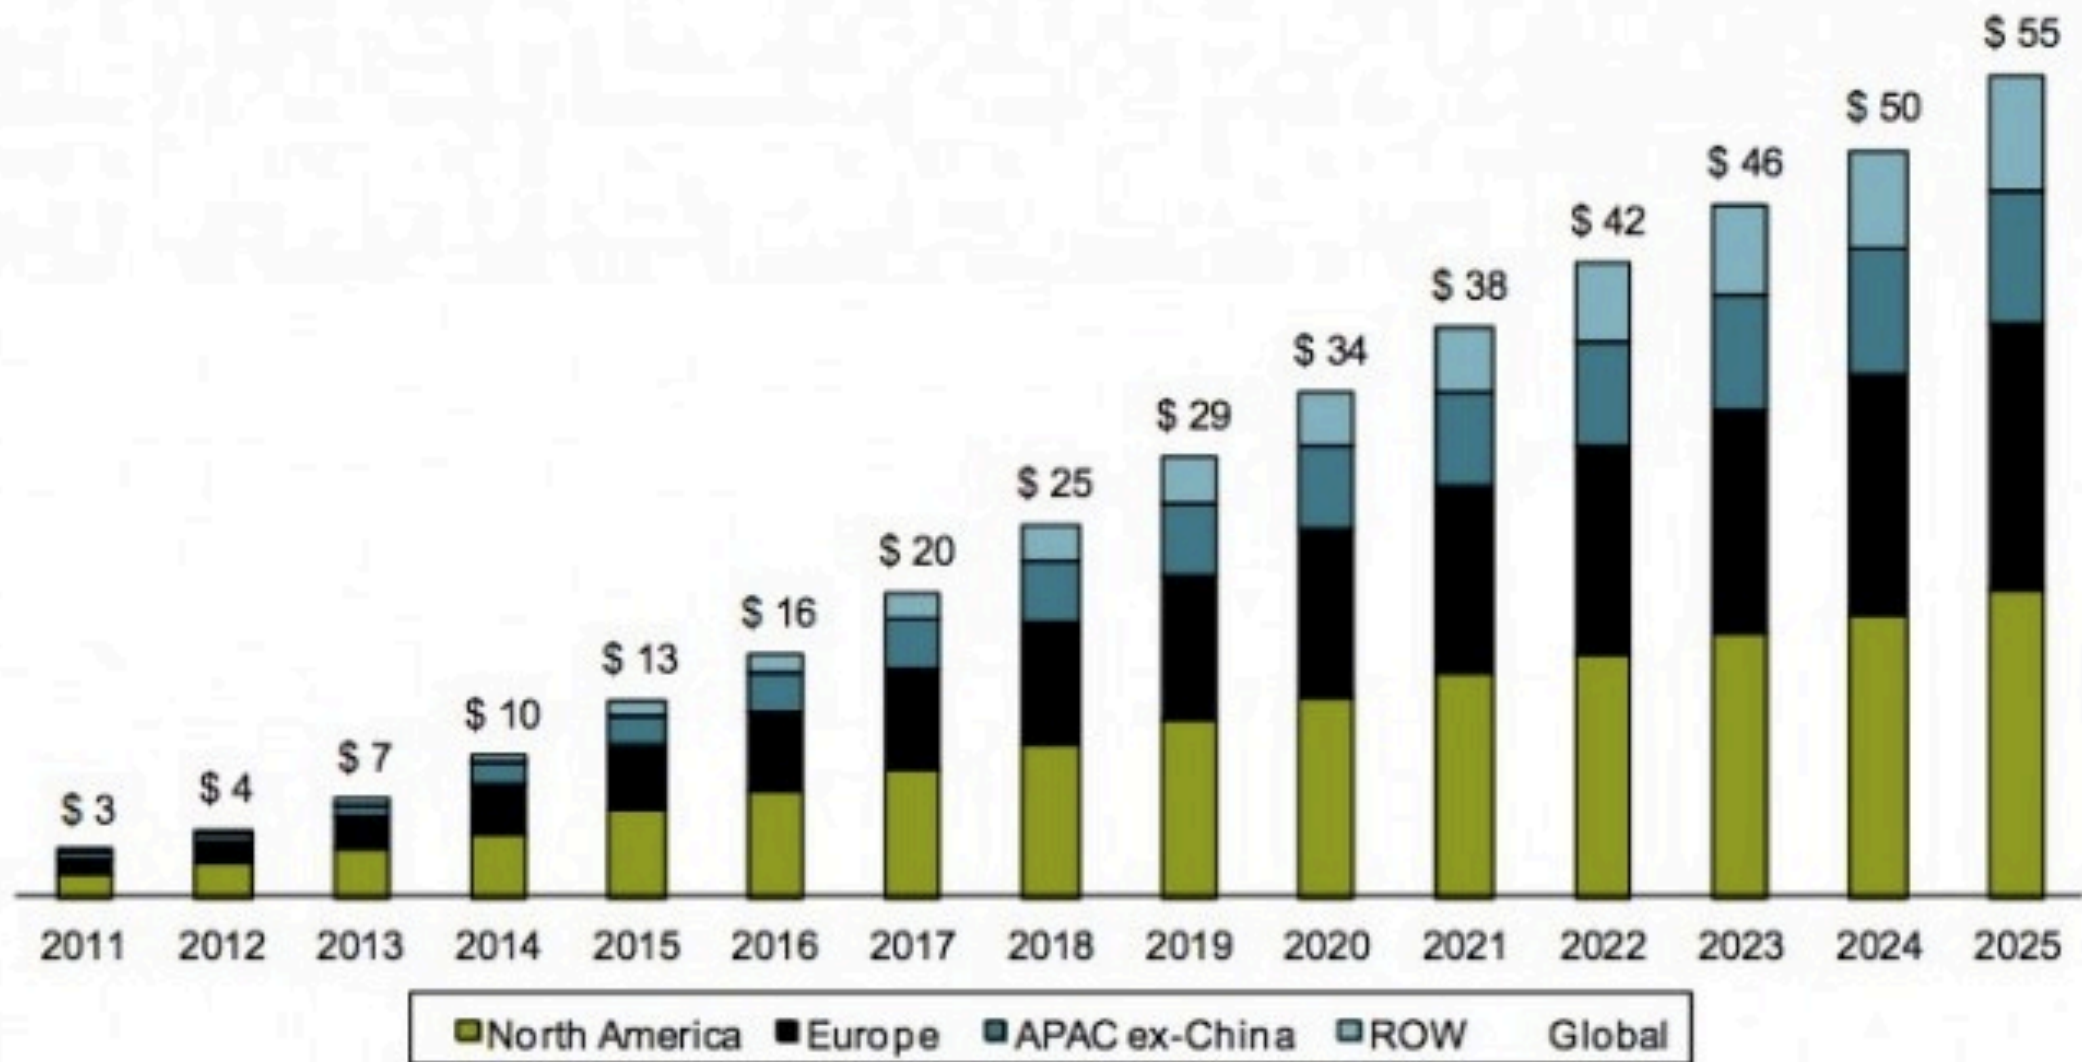

U.S. vs. International Revenues - Consolidated

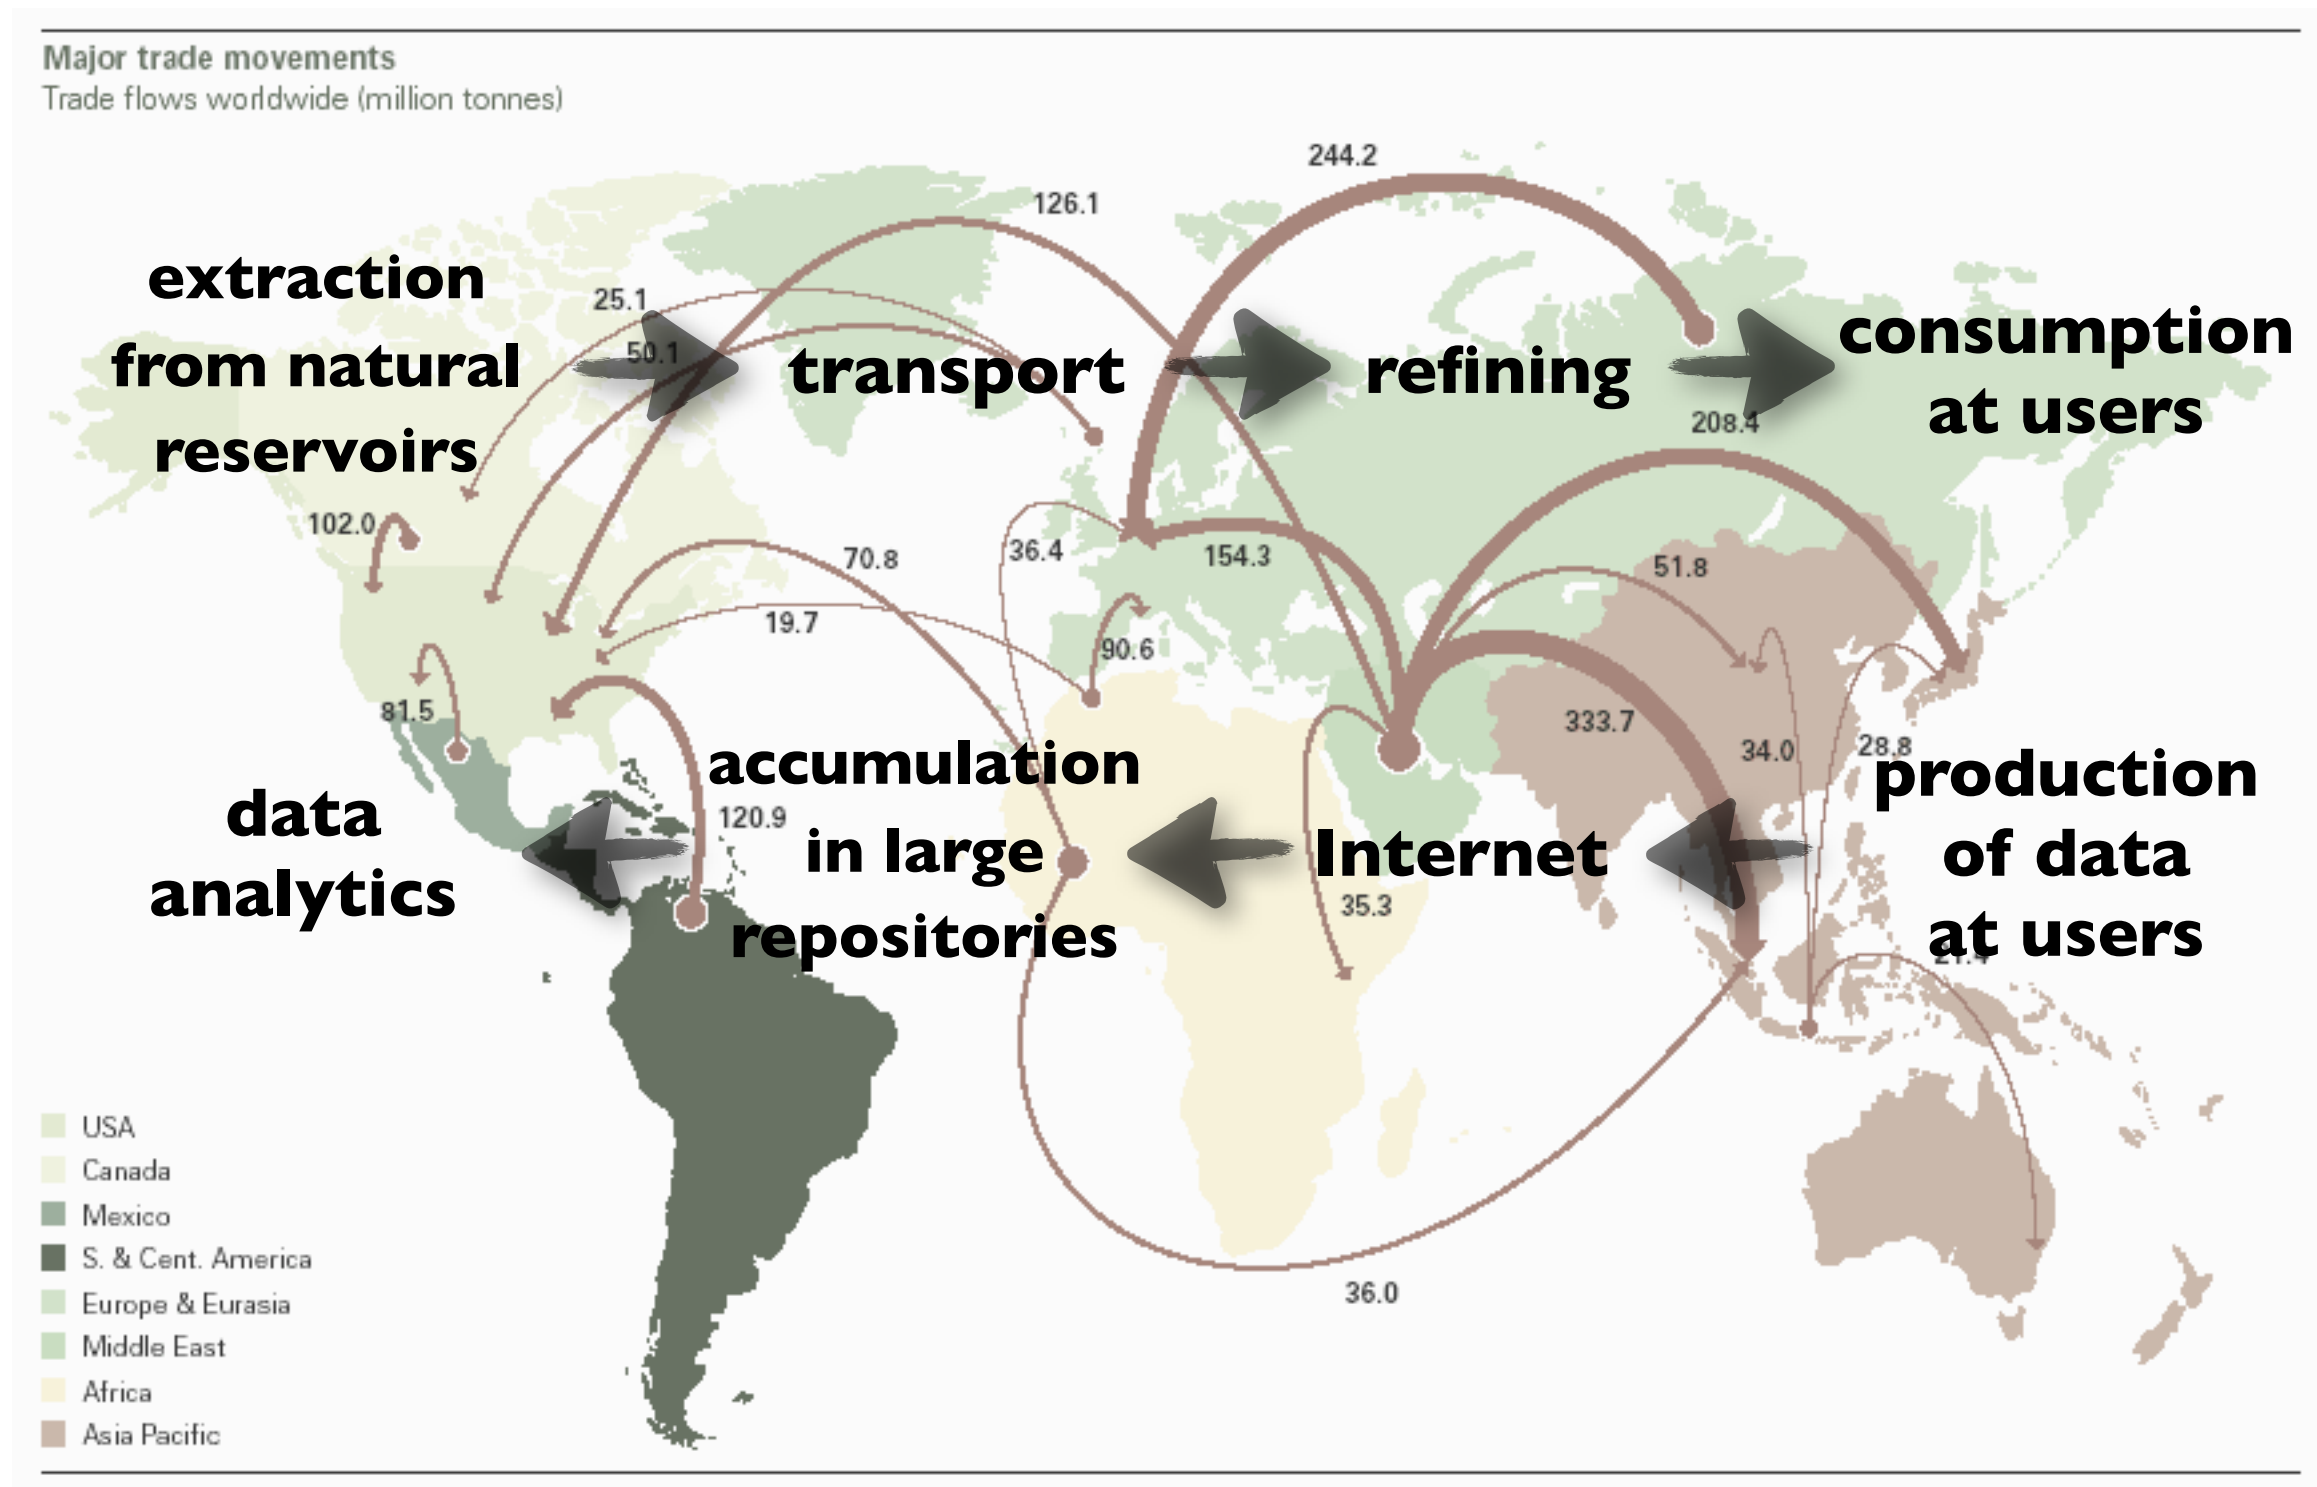

\$50 billion in 2012

Facebook revenue forecast

Data: raw material of the 21st century much like crude oil

The challenges of the industry

First challenge:

capture users and data
scale up as much as possible

Second challenge:

extract value / knowledge
stay as open as possible

Third challenge:

protect data and privacy

Size matters exponentially

number of users of a search engine

=> traffic

=> interest of advertisers

=> word auctions

=> relevance (because of price)

=> probability of successful click

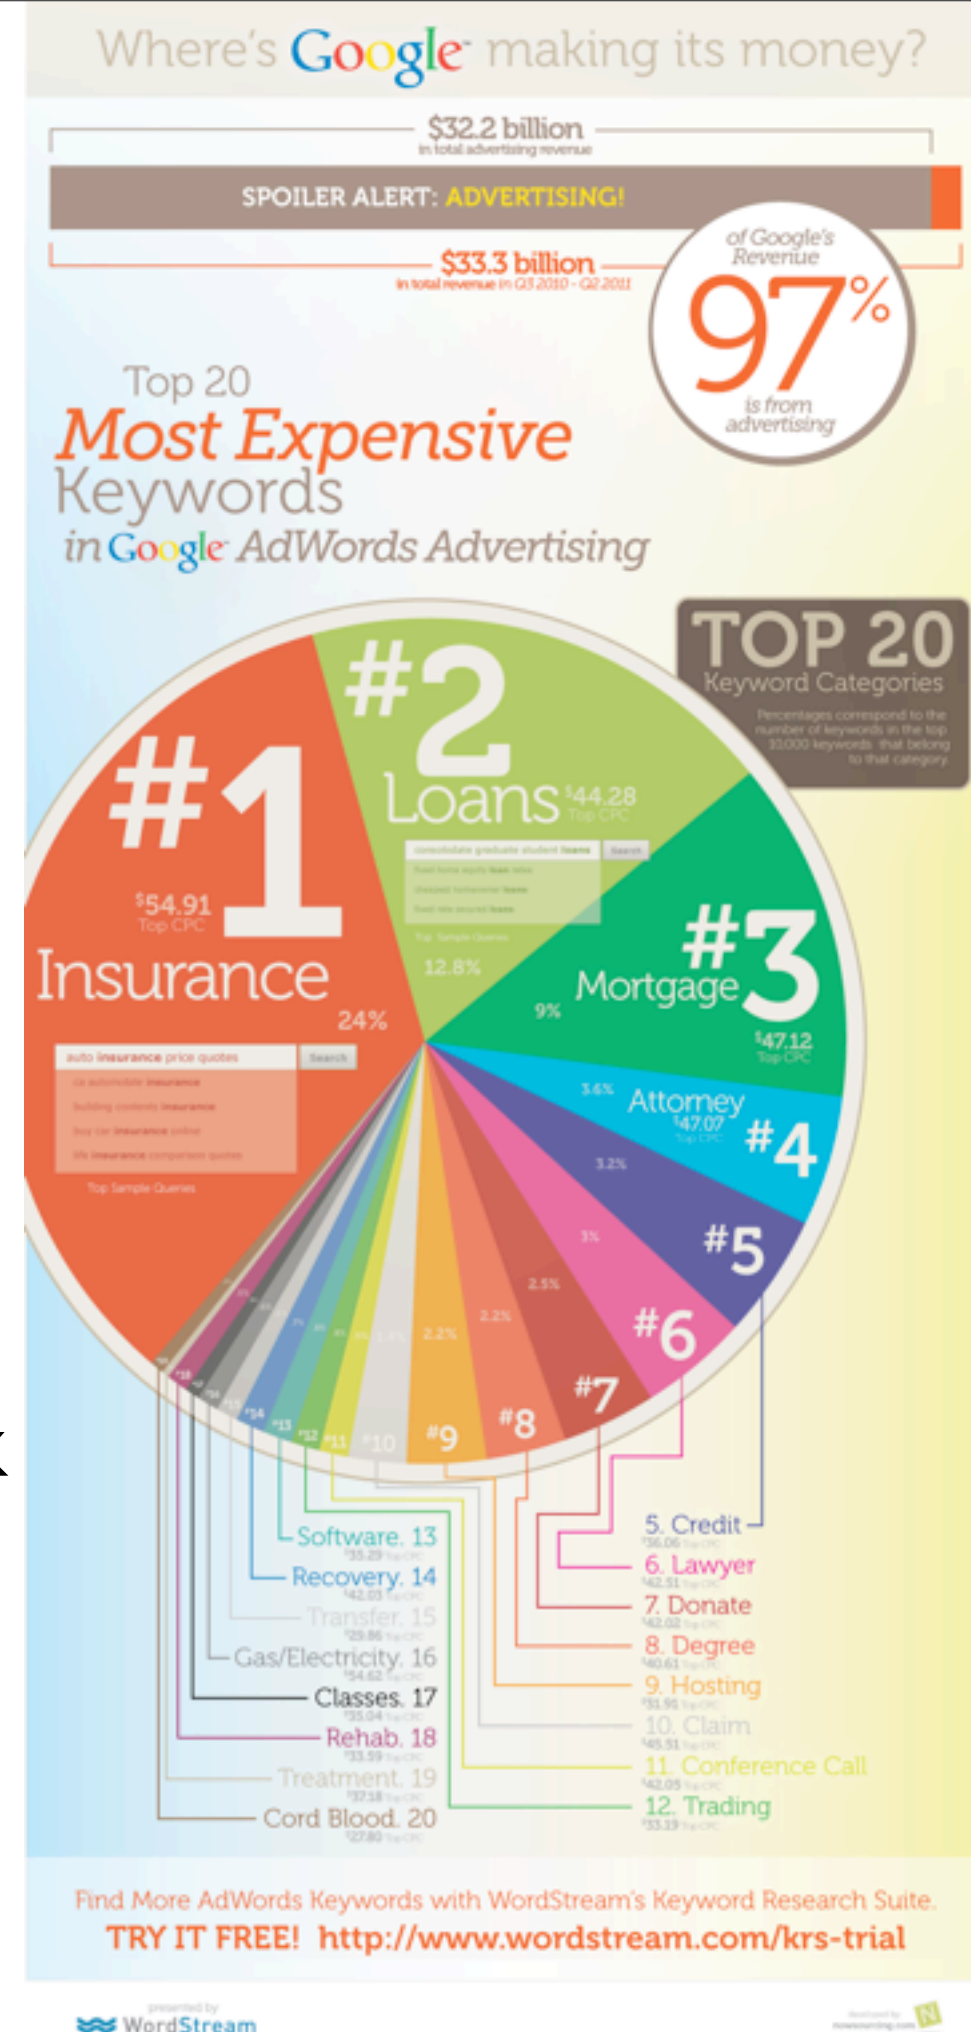

=> word covering

=> monetization covering

Thanks to François Bourdoncle

<http://www.wordstream.com/blog/ws/2011/07/18/most-expensive-google-adwords-keywords>

37

Data: new rules of the game

Data is a raw material,
to be transformed into value/information

Data is a money
“free” paradigm of the Web 2.0

Data can be duplicated at will
and is to ensure quality of service

Data can be transformed by people everywhere
Crowdsourcing

Internet giants as Extraterritorial powers

No real binding to the place of operation

Regulation, taxation: optimal use of national differences

Own raw material resources and industry
harvested without borders

Own legal systems
contracts users/corporations

Own monetary systems
emerging virtual currencies

Chapters

- I The age of information
- II A Web of Services
- III The Economy of Internet Data
- IV Cartography of data flows**
- V Europe at the periphery

Where are the data?

Huge concentration of data

85% of data handled by (large) **corporations**

Virtualization/dematerialization of infrastructures

Social networks, Cloud, ...

Most of the prominent corporations based in the **USA**

Google, Facebook, Amazon, Twitter, ...

Storage capacity of Europe = 70% USA [McKinsey 2011]

Data from the Web 2.0

produced by users everywhere in the world
but accumulated by corporations most often abroad

Percentage of national web corporations among top 25 by country

- **USA: 100%**
- **China: 92%** (only Google makes it in the top 25)
- **France: 36%** (but mostly marginal sites, not data intensive)
leboncoin, Orange, Free, commentcamarche, lemonde, lequipe, lefigaro, pagesjaunes, sfr

The Top 50 websites worldwide

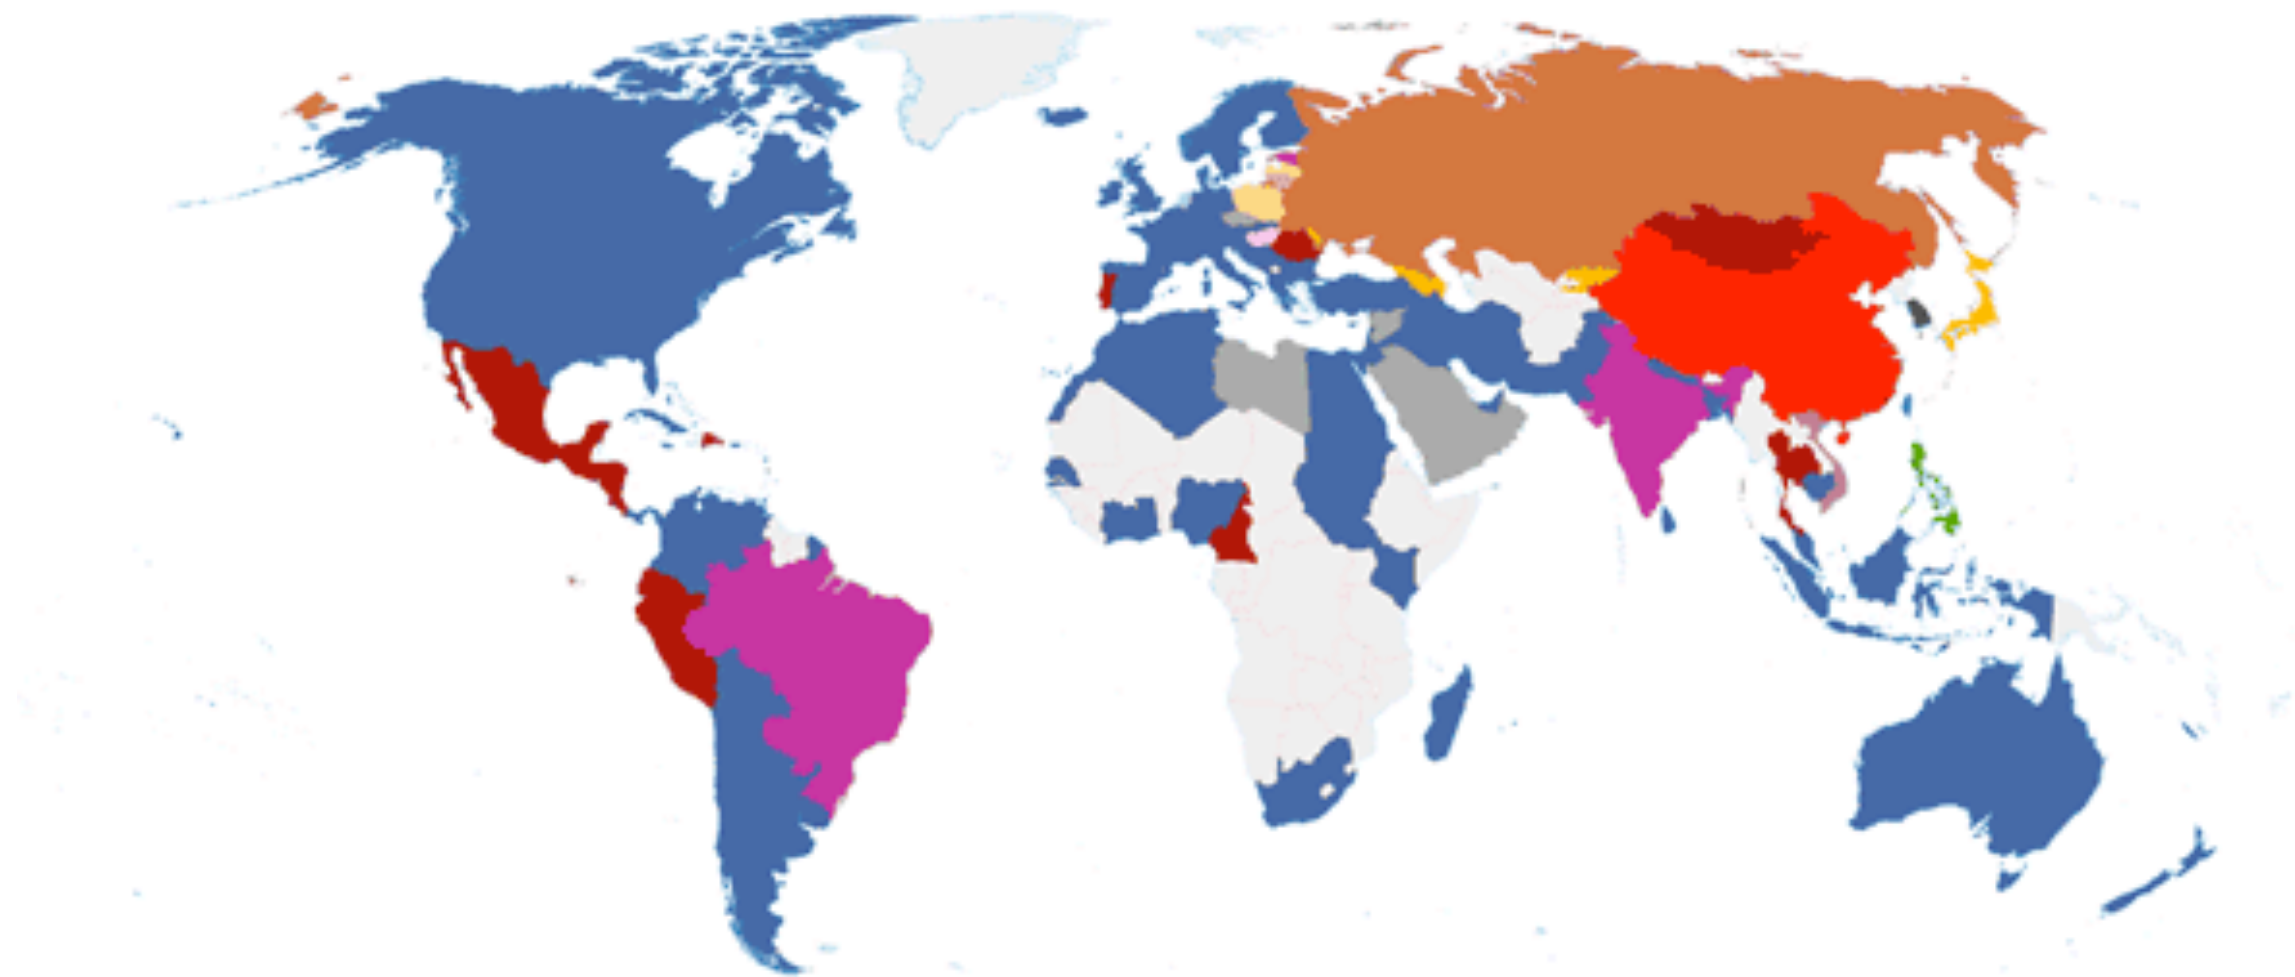

- USA: 72 %
- China: 16 % (Baidu: 5; QQ: 8; Taobao: 13; Sina: 17; 163: 28; Soso: 29; Sina weibo: 31; Sohu: 43)
- Russia: 6 % (Yandex: 21; kontakte: 30; Mail: 33;)
- Israel: 2 % (Babylon: 22)
- UK: 2 % (BBC: 46)
- Netherlands: 2 % (AVG: 47)

Facebook's territory

WORLD MAP OF SOCIAL NETWORKS

sources: Google Trends for Websites/Alexa

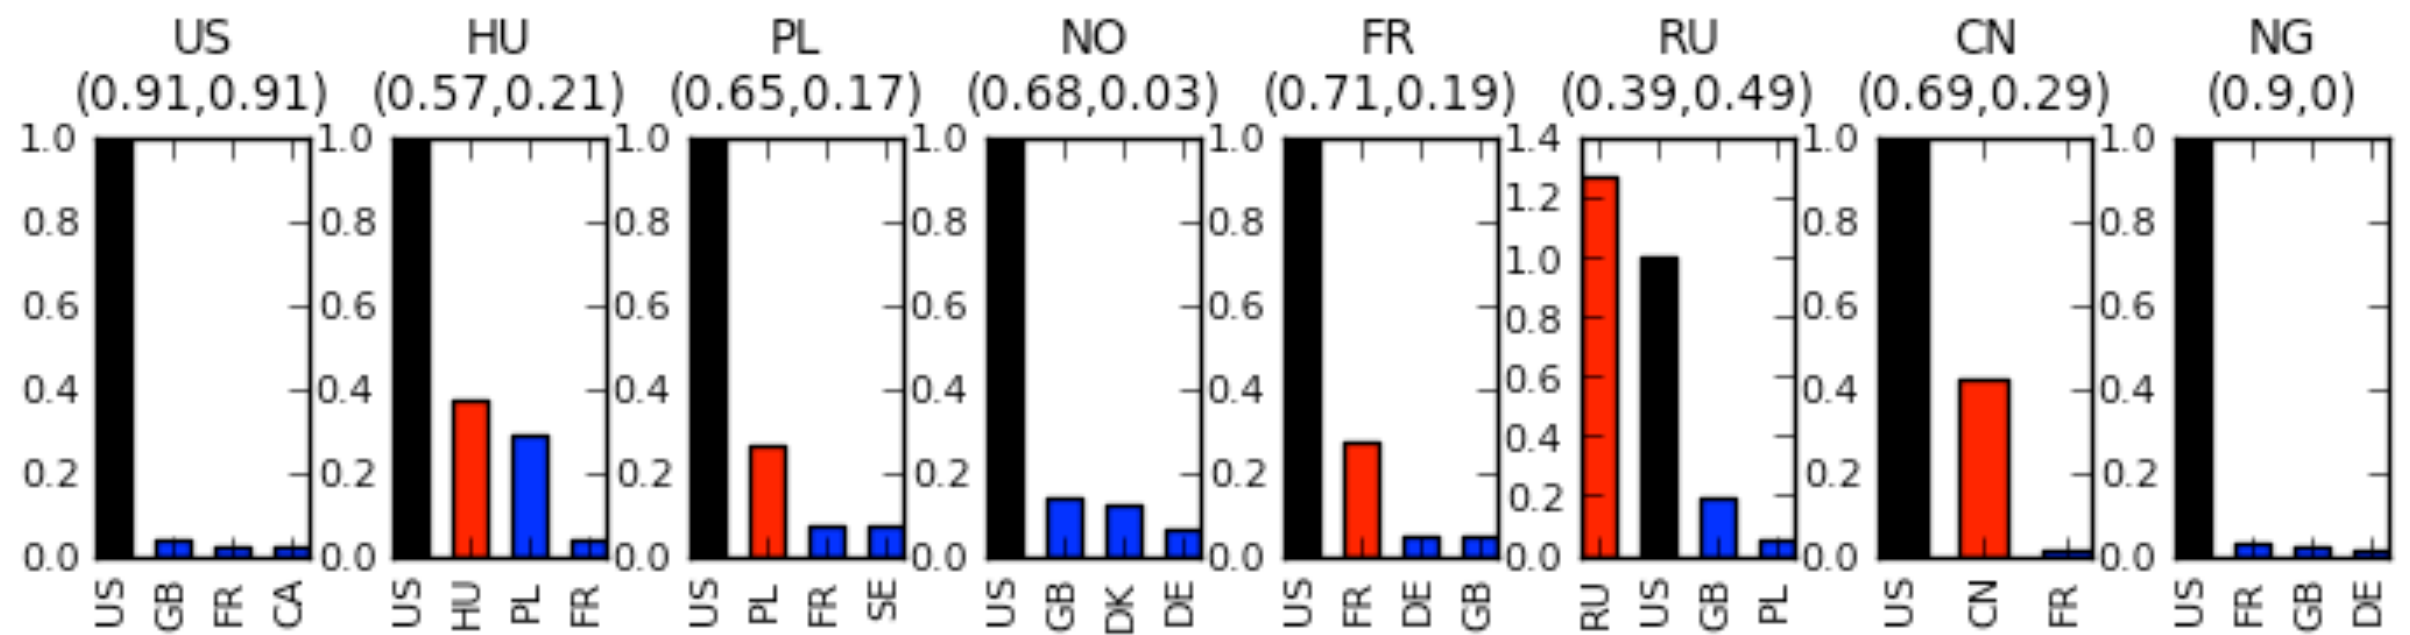

Diversity of search engines

- USA: Google: 65 % ; Bing: 15% ; Yahoo: 15%
- China: Baidu: 78% ; Google: 16%
- Russia: Yandex: 60% ; Google: 25%
- UK: Google: 91 % ; Bing: 5%
- France: Google: 92 % ; Bing: 3%

In France,

- Google has a de facto monopoly
- Google knows more about France than INSEE

Global tracking

Proportion of trackers in different countries

Joint work with Claude Castellucia & Lukasz Olejnik

Chapters

- I The age of information
- II A Web of Services
- III The Economy of Internet Data
- IV Cartography of data flows
- V Europe at the periphery**

What's at stake in Europe?

A general fear of new technologies

An inefficient industrial/innovation environment
no strong corporation emerging in IT

A strong suspicion with respect to personal data
very high concern for privacy protection

But carefree growing dependence on foreign systems

A disappointing path with IT

Failure to catch up with computing, networking, and digital technologies

in the 1970's with computers, chips,

in the 1990's with the Web and its services

in the 2000's with the information industry

in the 2010's with the radical societal shift?

Although many concepts were invented in Europe

What personal data mean for Europeans?

What personal data mean for Europeans?

The digital precautionary principle

The European dream: allow systems with
a predefined service
using the minimal amount of data required for that service

The exact opposite of Facebook's approach
open to apps on private data with users consent

Can personal data be protected ? **not clear to what extend**
Shall systems be restrained ? **not clear for which profit**

IT is not yet another technology

IT will eventually controls everything in our economies / societies
commerce, transportation, production, energy, ...
education, public services, ...

IT forces to revisit our economic/monetary/fiscal systems
but technology evolves faster than regulation though

IT will eventually change political systems
online identity
political (democratic) processes

The risk of a strong dependency

Global imbalance

information asymmetry (the knowledge is where the data is)

No impact on technological/societal choices

Europe advocates “values”, but with no means to promote them

Some regulations might not be implementable

Technological changes are now much faster than societal changes

Underdevelopment

Dependency on foreign powers for fundamental utilities

Loss of supremacy

No full control of laws, currencies, etc.

Conclusion

Europe
is at
the periphery
of
the information society

Eventually
politics
will take place
on the net

Eventually
data
will surpass
crude oil
in importance
